PakWheels used car listings, September 2026

What 10,589 adverts say about asking prices in Pakistan. Source: Kaggle, "Pakistan Used Cars Dataset: Prices and Specs 2026" (danishjmeo).

The dataset

This is a scrape of used car adverts from PakWheels, all collected on one day, 28 September 2026. Each of the 10,589 rows is one advert with 17 columns: make, model, variant, model year, asking price in rupees, mileage, fuel type, transmission, engine size, city and the advert link, plus three flag columns added by whoever prepared the file.

Two things shape everything that follows. The prices are what sellers are asking, not what anyone paid, and there is no way to tell from the data whether a car sold. And because it is a single day, any statement about age compares different cars built in different years. It does not follow one car as it gets older.

The data looks real rather than generated. Prices cluster on round figures, two thirds of mileages are round thousands, three makes dominate, and the relationships between age, engine size and price are the ones you would expect.

What was cleaned, and why

The file is called "clean", and structurally it is. There are no duplicate rows, no repeated advert links, and no car listed twice with identical details. Make, fuel and transmission labels are consistent. The problems are in individual values typed by sellers.

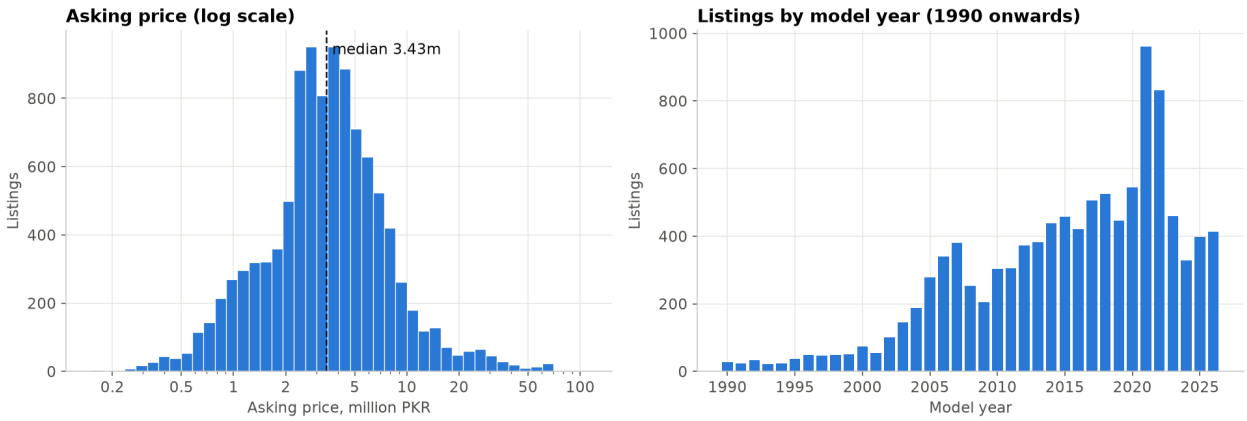

Step	Rows	Reason
Dropped adverts with a price over 3x or under 1/3 of the median for the same model and year	3	An MG ZS at 82 million PKR (peers about 8.3 million) and a Corolla and a Civic at about a tenth of the going rate
Blanked mileage of 500,000 km or more, or over 60,000 km per year of age	76	Filler values such as 999,995 and 989,898, and a 2024 Wagon R showing 800,000 km
Blanked mileage under 1,000 km on cars from 2023 or earlier	121	Placeholders like 123, 786 and 100 km on cars that are ten or twenty years old
Blanked engine sizes under 650 cc	6	A 100 cc Honda City, a 250 cc Mehran
Filled missing fuel type from the advert title	10	All were plug-in hybrids or Deepal S05 range-extender cars
Merged spellings: model Ek / eK / EK, two variant labels, four city aliases	-	Dgkhan and Dera Ghazi Khan are the same place; 193 city names became 191

That leaves 10,586 adverts. The file came with 95 mileages and 10 engine sizes already blanked by the uploader, so after my additions 292 adverts have no mileage and 108 have no engine size (92 of those are electric cars, where a blank is correct). I did not fill any of these in. The uploader also flags 774 adverts as price outliers, which turns out to be everything from 10.5 million PKR upward. Those are Land Cruisers, Prados and new SUVs, real cars at real prices, so I kept them and used medians throughout.

One problem I could not fix: the year is whatever the seller picked, and a handful do not match the car. There is a "1973 Nissan 350Z" and a "2023 Willys M38". They are few and they stay in.

What is on sale

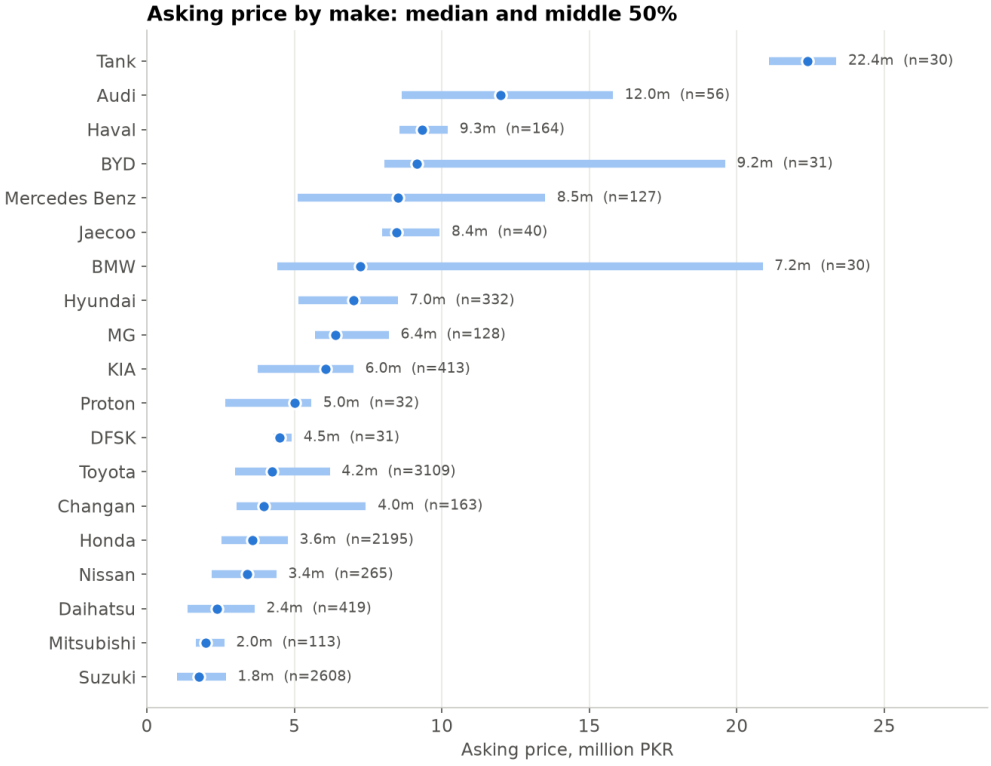

The median advert is a 2017 car with 89,000 km asking 3.43 million PKR. Half of all prices fall between 2.18 and 5.5 million, but the range runs from 150,000 to 108 million, so the average (4.92 million) is pulled well above the median. Toyota (29.4%), Suzuki (24.6%) and Honda (20.7%) together make up 74.7% of listings. Lahore, Karachi and Islamabad account for 66.3%, and 145 of the 191 cities have fewer than ten adverts each. Two thirds of the cars (66.0%) are automatic and 86.4% run on petrol.

Asking prices on a log scale, and the number of listings by model year. 2021 is the most common year with 961 listings.

Price by make and model

I only ranked makes and models with at least 30 listings, which leaves 19 makes and 54 models. Among makes, Tank has the highest median at 22.4 million and Suzuki the lowest at 1.75 million. The order needs reading with care. Tank, BYD, Jaecoo and Haval sit near the top partly because their stock is almost entirely 2025 and 2026 cars, while the median Suzuki on sale is from 2015 and the median Mitsubishi from 2007. The chart ranks what is being offered, not which badge holds its value.

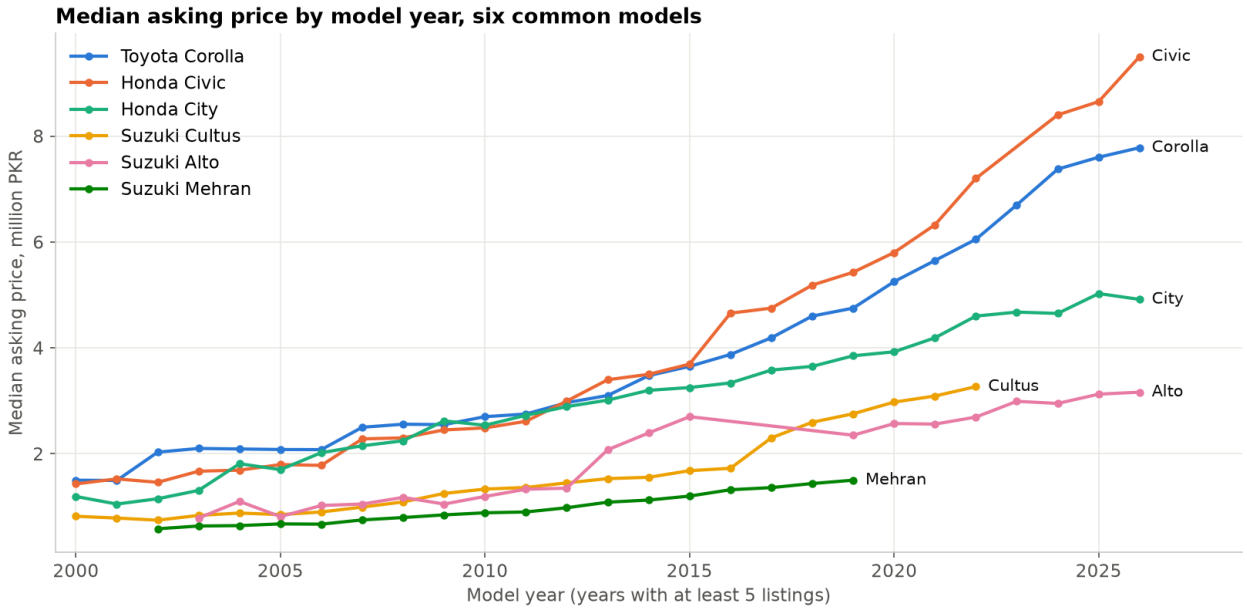

Median asking price by make, with the bar covering the middle half of listings. Makes with 30 or more listings.

By model, the Toyota Corolla is the most listed car in the country with 1,241 adverts (median 3.67 million), followed by the Honda Civic (960) and Honda City (831). The Toyota Land Cruiser has the highest median of any model with enough listings, 28.55 million, ahead of the Tank 500 (22.4 million) and the Prado (16.25 million). At the other end is the Suzuki Khyber at 0.5 million, then the Mehran at 0.93 million across 501 adverts.

Age and mileage

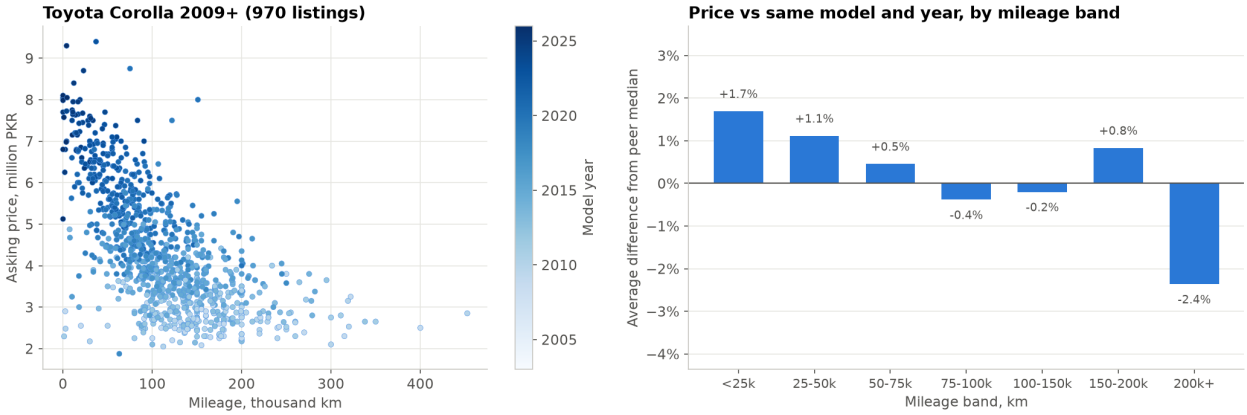

Model year is the strongest single correlate of price (Spearman 0.68), ahead of engine size (0.62) and mileage (-0.42). The median asking price is 8.91 million for 2026 cars, 5.24 million at five years old, 3.5 million at ten and 1.75 million at twenty.

Median asking price by model year for six common models, years with at least five listings.

Within a model the step down is steady. Fitting a simple slope to cars up to 15 years old, for the 21 models with 100 or more such listings, asking prices fall by between 2% and 10% per year of age, and for most by 4% to 9%: about 8.0% for the Civic, 6.8% for the Corolla, 5.1% for the Alto and 4.3% for the City. A Corolla or Civic of around ten years old asks roughly half (0.51) of what a nearly new one does; a City 0.68 and an Alto 0.85. This is not depreciation in the strict sense, since a 2016 Civic is a different generation from a 2026 one with a different new price, but it is a fair guide to how the market steps down. Small Suzukis keep a floor: the newest Mehrans in the data are 2019 models, and the median Mehran still asks close to a million.

Mileage matters much less than I expected once age is accounted for. Comparing each car with others of the same model and year (possible for 8,855 adverts), cars under 25,000 km ask about 1.7% more than their peers and cars over 200,000 km about 2.4% less. In between there is no clear pattern. Given how rough the mileage figures are, that may say as much about the quality of the column as about buyers.

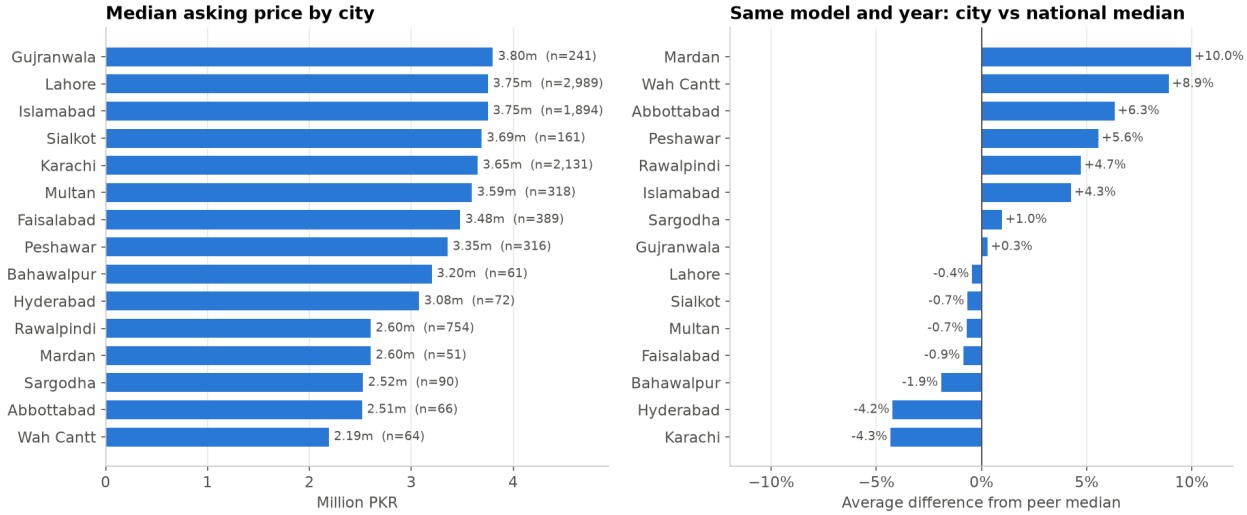

Left: Corolla price against mileage, shaded by model year. Right: price relative to same model and year, by mileage band.

Cities

Fifteen cities have 50 or more listings. Their raw medians range from 3.8 million in Gujranwala (with Lahore and Islamabad level at 3.75 million) down to 2.19 million in Wah Cantt. Most of that gap is the mix of cars. The median car in Wah Cantt is a 2010 model and 34% are automatic; in Lahore it is a 2018 model and 69% are automatic.

Compared like for like, the differences are small but not nothing. Karachi comes out 4.3% below the national figure for the same model and year and Hyderabad 4.2% below, while Islamabad (+4.3%), Rawalpindi (+4.7%) and Peshawar (+5.6%) come out above. Mardan, Wah Cantt and Abbottabad show the largest gaps, +6% to +10%, on only 42 to 56 comparable cars each. The data cannot say why. Registration province, condition and import status are all missing.

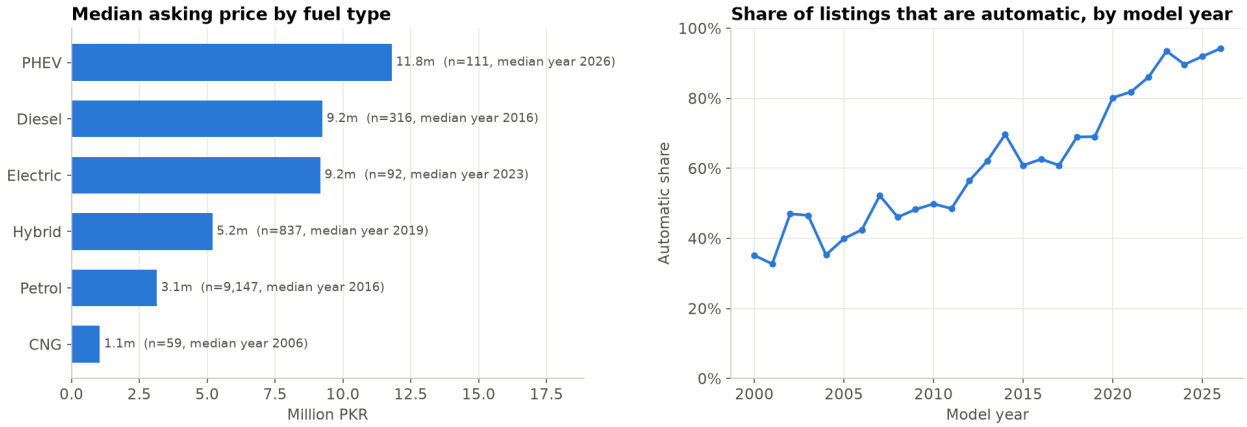

Left: raw median price by city. Right: average difference from the median for the same model and year. Cities with 50 or more listings.

Fuel, transmission and engine size

Plug-in hybrids have the highest median price, 11.8 million across 111 adverts, and their median model year is 2026. Diesel (9.25 million) and electric (9.18 million) follow; the diesels are mostly large Toyota 4x4s and pickups. Ordinary hybrids ask 5.2 million, petrol 3.15 million and CNG 1.05 million, the CNG cars having a median year of 2006.

Automatics ask a median of 4.6 million against 1.8 million for manuals, but the automatic fleet is eight years newer. In the 107 model-year groups that have at least three of each, the automatic premium is

10.6% at the median and automatics ask more in 89% of groups. The share of automatics rises from 35% of year-2000 cars to 94% of 2026 cars.

Median price by fuel type (30 or more listings), and the share of automatic cars by model year.

Price rises with engine size, from 1.66 million for 661 to 1000 cc up to 15.5 million above 3000 cc, with one exception. The 660 cc class asks 2.73 million, more than the class above it. The 660s are mostly recent kei cars and newer Altos (median year 2019), while the 661 to 1000 cc group is full of older Mehrans and Cultus (median year 2014).

Highest, lowest, most

- Most expensive advert: a 2023 Lexus LX 600 Ultra Luxury in Islamabad at 108 million PKR. 44 adverts ask 50 million or more.
- Cheapest: a 1984 Suzuki FX in Islamabad at 150,000 PKR. 812 adverts ask under 1 million.
- Most listed model: Toyota Corolla, 1,241 adverts. Most listed make: Toyota, 3,109. Most listed city: Lahore, 2,989.
- Highest median price among models with 30 or more listings: Toyota Land Cruiser, 28.55 million. Lowest: Suzuki Khyber, 0.5 million.
- Highest median among makes: Tank, 22.4 million. Lowest: Suzuki, 1.75 million.
- Oldest model year: 1961, a Willys M38 in Islamabad at 1.6 million.
- Highest mileage that survived the checks: 491,000 km on a 1984 Toyota Corona in Faisalabad.
- Most expensive electric car: a 2023 BMW i7 in Karachi at 62.5 million. Most expensive manual: a 2007 Toyota Coaster 29-seater at 14.5 million.
- Most common model year: 2021, with 961 listings. 811 adverts (7.7%) are 2025 or 2026 cars, and 159 of those show under 1,000 km.
- Largest engine: 5,700 cc, on ten adverts, the dearest being a 2021 Lexus LX570 at 69 million.

Conclusion and limits

The picture is of a market dominated by three Japanese makes and three cities, where the age of the car explains most of the asking price and everything else, mileage, city, gearbox, shifts it by single-digit to low double-digit percentages once you compare the same model and year. The headline gaps between cities, fuel types and makes are mostly gaps in what is being sold.

The limits are real. These are asking prices from one website on one day. Seller-typed fields are noisy, and the mileage rules I applied are judgement calls that someone else might set differently. There is nothing on condition, accident history, registration, import status or whether the seller is a dealer. And apart from the 15 largest cities, the city data is too thin to say anything.

If I had more time or data, the obvious next steps would be a proper regression of price on model, year, variant, mileage and city to put all of these effects in one model; a variant-level look at the Corolla, Civic and City, where trim levels differ a lot; and a second scrape a few months later, which would turn this from a snapshot into something that can say how prices are moving and which adverts disappear.
